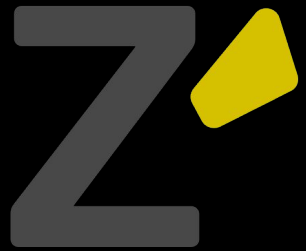
Real-time Project Collaboration

# Why Do We Need It?

- To collaborate easily
- Keep Better Schedules
- Delegate Tasks Easily
- Enjoy all aspects of project management in one place
- Part Slack; Part Google Doc; Part Trello

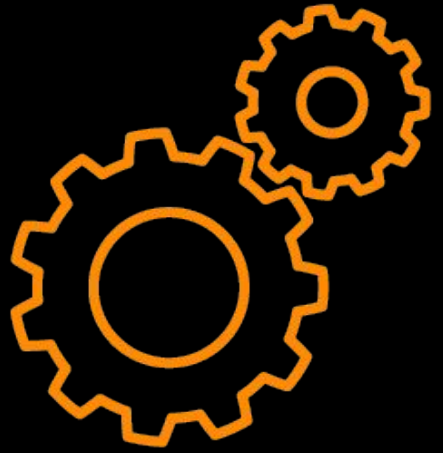


# Highlights

# Collaborate on a single document in real-time:

- Enabling all the team members to contribute and collaborate on the single doc in real-time
- It allows team members to share documents, timelines and task updates in realtime leading to better time utilization and increased productivity
- Realtime chat that allows users to discuss questions, concerns and get answers they need without having to wait or go to another source.

# Planning Tools:

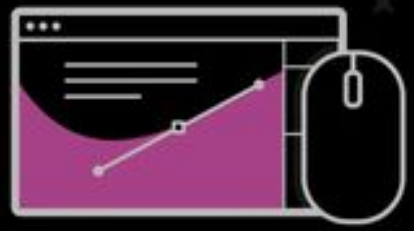


We are trying to create a single workspace where different project management tools can co-exist at the same time on a single workspace. This will enable users to brainstorm and manage tasks in a simpler and efficient manner

# Chat

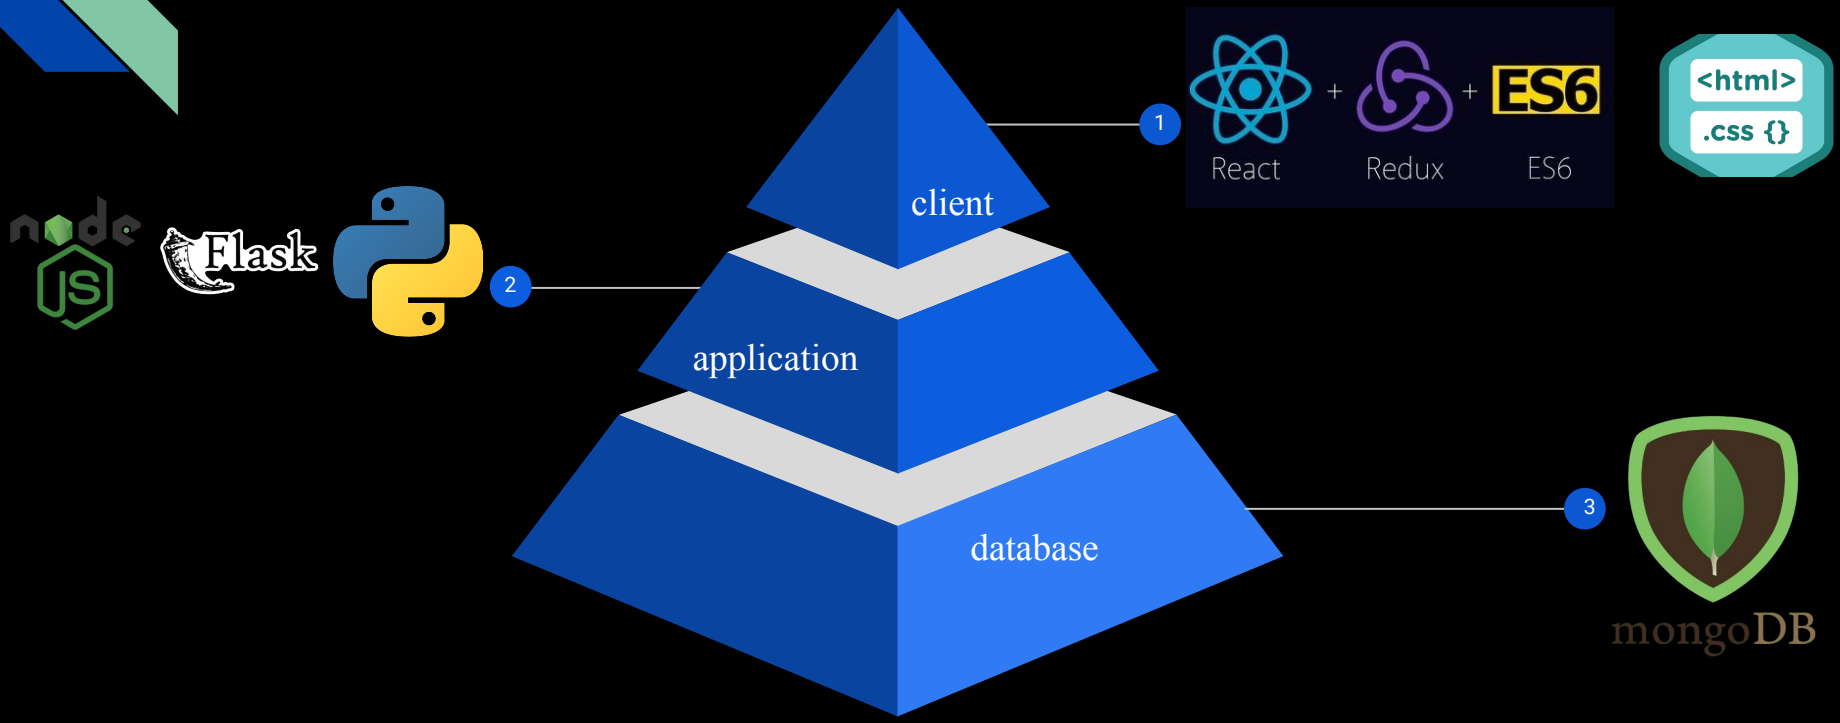
Slack-like feature for teams to share and chat: enables team members to message each other while working on the same workspace in real time.

# Minimalist UI:



- Simplistic
- High clarity
- High attention to proportions and composition
- Big amount of spare space
- High attention ratio to core details

# Architecture/Technology stack



3-Tier Architecture
